Backup in a Box

The Rain Backup in a Box® is fitted inside the building where the occupiers can see and hear it. When rainwater has run out in the underground tank, a float switch that is in the underground tank will drop and open the solenoid valve. Mains water will flow to the tank and put a small amount of water into the tank to ensure that the pump keeps running.

There are two models of The Rain Backup in a Box®.

BUB01 has a traditional float switch that lifts and drops dependent on the water level. This are best used in deep tanks.

BUB02 has a switch that triggers when the water levels drops but when the switch lifts due to the water level the water flow will continue for 45 minutes. This model is best used in a shallow dig tank.
